

Gerardo Sanchez

Data & AI Engineer

I turn scattered business data into dashboards and AI tools that people actually use, from the warehouse to the screen.

Experience

Independent Data & AI Engineer · Corporate clients OCT 2025 - PRESENT

- Designed a serverless platform on Google Cloud (Cloud Functions, Pub/Sub, Cloud Storage, BigQuery, Secret Manager, budget controls) that brings sales, marketing and operations data into one warehouse.
- Built a Python webhook service that sends offline CRM sales to the Meta Conversions API, tying revenue to ad spend for a business with no pixel and no prior attribution. In production within a week.
- Modelled the warehouse in dbt with quality tests, with a Looker Studio dashboard for leadership on top.
- Traced a funnel from ad to website, message, appointment and sale to find where volume was lost, and ranked the fixes by impact.
- Run and maintain what I ship under monthly service agreements; every project so far started as an analysis I proposed to management.

Lead Data Analyst · TortiRegias · Nyjisa · Chilokia JAN 2024 - OCT 2025

- Led the data side of the group-wide Alpha ERP rollout, working with every department head: process documentation, data traceability and quality controls, and the SQL (MS SQL Server, MySQL) reconciling purchasing, sales, production and accounting.
- Built App Tarimas, a React drag-and-drop app that generates Walmart CEDIS pallet labels with scannable barcodes. An impractically slow manual task now takes about two minutes.
- Built a Power BI production dashboard and a maintenance dashboard (Dashboard de Mantenimiento), plus Streamlit views, that gave management its first live view of operations; presented findings weekly.
- Designed a manufacturing cost model inside the ERP that surfaced unit cost and margin per product for the first time.
- Automated recurring PDF reports and payroll receipts in Python, removing about two months of manual work a year.

Undergraduate Researcher · UANL, Facultad de Ciencias Físico Matemáticas 2022 - 2025

- Thesis on gravitational microlensing: derived the lensing model from first principles, simulated it in Fortran over a wide parameter sweep, and produced 223k labelled light curves to train a classifier that detects microlensing events.

Education

B.S. Physics
UANL, Monterrey · 2019 — 2023

AI & Machine Learning
Caltech CTME · 2024

Applied Data Science
Simplilearn · 2024

Skills

Languages

Python, TypeScript, JavaScript, SQL, Bash, Fortran

Data & BI

BigQuery, dbt, PostgreSQL, MySQL, MS SQL Server, Power BI, Looker Studio, Streamlit, pandas

Cloud & Web

Google Cloud (Cloud Run, Functions, Pub/Sub, Secret Manager), Cloudflare, Next.js, React, REST, OAuth, webhooks

AI

OpenAI & Claude APIs, LLM classification with structured output, multi-agent tooling, scikit-learn

Practice

Git, GitHub Actions, Linux, ADRs, AI-assisted development

Selected Projects

Money on Rails

Connects to YNAB and tells you what YNAB won't: an adherence rating, a plan-quality score and where each month's money went. Invite-only 1.0 shipped September 2026.

App Tarimas

Pallet-labelling app for Walmart orders; cut labelling to about two minutes.

Sales & appointments dashboards

Live demos on gsanchez.me for two invented companies: Casa Zenzontle (retail) and Molara Dental (clinics).
